

Pokedex Lite

Goal

Create a simple program or small app that allows a user to look up information for any pokemon using [PokeAPI](#). You are free to use any language/framework. Visual representation/GUI would give you bonus points.

Requirements

1. Fetch Pokemon data from the API
2. Input: The user enters a name or ID number
3. Output:
 - Name
 - ID number
 - Height - in meters
 - Weight - in kg
 - Type (Fire, Water, Grass, etc.)
 - Base Stats (HP, Attack, Defense, etc.)
 - Image (if language/framework supports it) - Use `front_default` sprite
4. Handle invalid input - show according error text in case a request fails

Example output (console version)

1. Valid name

```
Welcome to Pokedex Lite!
```

```
Enter a Pokemon name or ID: pikachu
```

```
Name: Pikachu
```

```
ID: 25
```

```
Height: 0.4 m
```

```
Weight: 6.0 kg
```

```
Types: Electric
```

```
Stats:
```

```
  HP: 35
```

```
  Attack: 55
```

```
  Defense: 40
```

```
  Speed: 90
```

2. Invalid name

Welcome to Pokedex Lite!

Enter a Pokemon name or ID: something

Pokemon not found. Try another name or ID.
